

What is claimed is:

1. A pneumatic tire provided with a groove extending in a tire circumferential direction in a tread surface, comprising:

line portions provided in a wall face of the groove, the line portions being composed of a plurality of ridges or recesses inclined in one direction with respect to a groove longitudinal direction.

2. The pneumatic tire according to claim 1, wherein an inclined angle of the line portions with respect to the groove longitudinal direction is 10 to 60°.

3. The pneumatic tire according to any one of claims 1 and 2, wherein a height of the line portions is not smaller than 0.3 mm and is not more than 20% of each of a width and a depth of the groove.

4. The pneumatic tire according to any one of claims 1 to 3, wherein a pitch interval of the line portions is 1.5 to 8.0 mm.

5. The pneumatic tire according to any one of claims 1 to 4, wherein the line portions are provided in a range of not less than 50% of the wall face of the groove in a cross section of the groove orthogonal to the groove longitudinal direction.
